

How Do I Set Selective Release from a Tool's Inventory?

The Selective Release tool only includes items that have been added to the Home Page, folders, and learning modules. You may have items that are available only from a tool's main page, which contains an inventory of all items created using that tool.

EXAMPLE You instruct students to access course learning modules by going directly to the Learning Modules tool and selecting the current unit from the list. You do not provide links to the units in any other location, such as the Home Page or a folder. You selectively release the units by date, to keep students working on the same content at the same time and to prevent them from being overwhelmed by a large amount of content.

⇒ To apply release criteria to items only available from a tool's inventory listed under Course Tools:

1. Select the Course Tool link in the Course Menu. The main screen for the tool appears.
2. From the tool's inventory, click an item's ActionLinks menu, click **Set Release Criteria**.
